LIFETIME OY

INVESTOR DECK

V6 · 2026 Q3

A governed system of action
for regulated European industry.

SECTION 01

THESIS

Lifetime is building **DWS IQ**, a governed system of action for regulated European industry. It turns industrial workflows into controlled execution, signed evidence and reviewable outputs.

The company is **testing two routes to revenue**. Enterprise engagements are the current commercial focus. Nordic industrial SMEs are a second, unvalidated entry scenario.

SECTION 02

THE COMMERCIAL QUESTION

Which route produces the first repeatable paid customer motion?

SCENARIO A

Enterprise-led deployment through a narrow, production-relevant workflow.

SCENARIO B

SME entry through DWS IQ Essentials, followed by expansion to Pro and Enterprise.

Both scenarios use the same evidence architecture, control plane and contract model. **Neither is presented as validated** until a paid customer produces measurable evidence.

SECTION 03

SCENARIO A · ENTERPRISE WEDGE

Target: regulated industrial companies with a defined operational, compliance or evidence problem.

Current commercial conversations include **Outokumpu** and **Kemira**. These are enterprise prospects and examples of customer-specific discovery, not booked revenue or validated repeatability.

ENTRY MOTION

- one business owner
- one site, process or workflow
- one defined data boundary
- one measurable output
- one paid pilot decision

The product is adapted to the customer's problem. Partner products and infrastructure appear only when they solve a stated customer requirement.

SECTION 04

OUTOKUMPU EXAMPLE

Potential wedge: signed, machine-readable emissions evidence for downstream customer and CBAM workflows.

The hypothesis is that Outokumpu-sourced data could be delivered as an evidence packet that procurement, filing and audit systems can consume directly. The initial test is whether this replaces or improves an existing customer evidence package.

HYPOTHESIS — NOT YET VALIDATED

VALIDATION REQUIRED

- customer-owned workflow confirmed
- data source and verification authority confirmed
- measurable time, cost or acceptance benefit
- paid pilot scope and buyer identified

SECTION 05

KEMIRA EXAMPLE

Potential wedge: chemical process compliance recording using a customer-specific demo and controlled data upload.

The demonstration should use a defined scenario, such as process compliance recording, with a bounded CSV or approved sample dataset. The output must show the evidence produced, who reviews it and what a paid pilot would prove.

HYPOTHESIS — NOT YET VALIDATED

VALIDATION REQUIRED

- real process and pain point confirmed
- data boundary approved
- output reviewed by the responsible operator or compliance owner
- pilot benefit and acceptance criteria agreed

SECTION 06

SCENARIO B · SME ENTRY HYPOTHESIS

HYPOTHESIS — UNVALIDATED SCENARIO

Target scenario: Nordic industrial SME with multiple services or sites, a small IT team and a concrete need for safe updates, operational inventory or evidence.

DWS IQ Essentials is planned as the low-friction entry tier. The target customer profile, budget, decision cycle and Q4 timing are hypotheses, not traction.

ESSENTIALS WOULD INCLUDE

- inventory and service visibility
- evidence and audit export
- safe updates, health checks and rollback
- CLI and managed deployment
- GitHub and one operational runtime connector

SECTION 07

SME LADDER HYPOTHESIS

Essentials → Pro → Enterprise.

The test is whether a customer first buys operational risk reduction, then asks for governance, analytics or broader deployment capability.

PLANNED TESTS — NOT CURRENT PERFORMANCE

VALIDATION METRICS

>50%

of beta customers — of beta customers deploy within two weeks

>80%

connect both launch connectors

>30%

buy Pro within 90 days

Upgrade reason is governance or analytics, not missing core functionality.

SECTION 08

WHAT IS PROVEN TODAY

These are the factual foundations of the business:

- Lifetime has industrial software and compliance experience.
- DWS IQ is being structured around governed execution and evidence.
- Outokumpu and Kemira provide concrete enterprise discovery contexts.
- The current commercial work is narrowing toward customer-specific workflows and paid pilots.

NOT CLAIMED

Validated SME demand · Essentials revenue · Repeatable enterprise conversion · Retention · Churn · Software revenue beyond the canonical register

SECTION 09

BUSINESS MODEL

Enterprise: paid discovery or pilot, followed by production deployment and expansion.

SME scenario: Essentials entry, modular Pro expansion and eventual Enterprise path.

REVENUE SOURCES REMAIN SEPARATE

- software and governance
- deployment and integration
- recurring support

The product architecture is shared. Commercial validation is separate by scenario.

SECTION 10

EXECUTION PLAN

1. Convert one enterprise conversation into a paid, bounded pilot.
2. Produce a measurable customer-owned outcome for Outokumpu or Kemira.
3. Complete the Essentials launch gate before selling it.
4. Run the first SME beta only after deployment, rollback, evidence export, isolation and support controls pass.
5. Compare both motions by time to paid commitment, delivery effort, referenceability and expansion signal.

SECTION 11

FUNDING ASK

€650k SAFE

Valuation cap	€3.8M post-money
Discount	20%
Maturity	24 months

USE OF FUNDS

Enterprise pilot execution and conversion, Essentials launch-gate completion, EU sovereignty and evidence controls, and customer delivery capacity.

The purpose of the round is to test and convert the two GTM scenarios, not to imply that either is already proven.

SECTION 12

INVESTOR DECISION

Back Lifetime's ability to turn narrow regulated-industrial workflows into repeatable paid deployments, while treating the SME ladder as a measured scenario rather than established traction.
